

Sieve of Eratosthenes - Algorithms for Competitive Programming

<https://cp-algorithms.com/algebra/sieve-of-eratosthenes.html>

Given a number n , print all primes smaller than or equal to n . It is also given that n is a small number.

Example:

Input : $n = 10$

Output : 2 3 5 7

Input : $n = 20$

Output: 2 3 5 7 11 13 17 19

Following is the algorithm to find all the prime numbers less than or equal to a given integer n by the Eratosthenes's method:

When the algorithm terminates, all the numbers in the list that are not marked are prime.

Explanation with Example:

Let us take an example when $n = 100$. So, we need to print all prime numbers smaller than or equal to 100.

We create a list of all numbers from 2 to 100.

	2	3	4	5	6	7	8	9	10
11	12	13	14	15	16	17	18	19	20
21	22	23	24	25	26	27	28	29	30
31	32	33	34	35	36	37	38	39	40
41	42	43	44	45	46	47	48	49	50
51	52	53	54	55	56	57	58	59	60
61	62	63	64	65	66	67	68	69	70
71	72	73	74	75	76	77	78	79	80
81	82	83	84	85	86	87	88	89	90
91	92	93	94	95	96	97	98	99	100

Sieve of Eratosthenes

According to the algorithm we will mark all the numbers which are divisible by 2 and are greater than or equal to the square of it.

	2	3	4	5	6	7	8	9	10
11	12	13	14	15	16	17	18	19	20
21	22	23	24	25	26	27	28	29	30
31	32	33	34	35	36	37	38	39	40
41	42	43	44	45	46	47	48	49	50
51	52	53	54	55	56	57	58	59	60
61	62	63	64	65	66	67	68	69	70
71	72	73	74	75	76	77	78	79	80
81	82	83	84	85	86	87	88	89	90
91	92	93	94	95	96	97	98	99	100

Prime Numbers

2

Sieve of Eratosthenes

Now we move to our next unmarked number 3 and mark all the numbers which are multiples of 3 and are greater than or equal to the square of it.

71	72	73	74	75	76	77	78	79	80
81	82	83	84	85	86	87	88	89	90
91	92	93	94	95	96	97	98	99	100

Prime Numbers

2 3 5 7

Sieve of Eratosthenes

We continue this process, and our final table will look like below:

	2	3	4	5	6	7	8	9	10
11	12	13	14	15	16	17	18	19	20
21	22	23	24	25	26	27	28	29	30
31	32	33	34	35	36	37	38	39	40
41	42	43	44	45	46	47	48	49	50
51	52	53	54	55	56	57	58	59	60
61	62	63	64	65	66	67	68	69	70
71	72	73	74	75	76	77	78	79	80
81	82	83	84	85	86	87	88	89	90
91	92	93	94	95	96	97	98	99	100

Prime Numbers

2 3 5 7
11 13 17 19
23 29 31 37
41 43 47 53
59 61 67 71
73 79 83 89
97

Sieve of Eratosthenes

So, the prime numbers are the unmarked ones: 2, 3, 5, 7, 11, 13, 17, 19, 23, 29, 31, 37, 41, 43, 47, 53, 59, 61, 67, 71, 73, 79, 83, 89 and 97.

Implementation:

Following is the implementation of the above algorithm. In the following implementation, a boolean array `arr[]` of size `n` is used to mark multiples of prime numbers.

```

// C++ program to print all primes smaller than or equal to
// n using Sieve of Eratosthenes
#include <bits/stdc++.h>
using namespace std;

void SieveOfEratosthenes(int n)
{
    // Create a boolean array "prime[0..n]" and initialize
    // all entries it as true. A value in prime[i] will
    // finally be false if i is Not a prime, else true.
    bool prime[n + 1];
    memset(prime, true, sizeof(prime));

    for (int p = 2; p * p <= n; p++) {
        // If prime[p] is not changed, then it is a prime
        if (prime[p] == true) {
            // Update all multiples of p greater than or
            // equal to the square of it numbers which are
            // multiple of p and are less than p^2 are
            // already been marked.
            for (int i = p * p; i <= n; i += p)
                prime[i] = false;
        }
    }

    // Print all prime numbers
    for (int p = 2; p <= n; p++)
        if (prime[p])
            cout << p << " ";
}

// Driver Code
int main()
{

```

```

int n = 30;
cout << "Following are the prime numbers smaller "
      << " than or equal to " << n << endl;
SieveOfEratosthenes(n);
return 0;
}

```

Output

```

Following are the prime numbers smaller than or equal to 30
2 3 5 7 11 13 17 19 23 29

```

Time Complexity: $O(n \cdot \log(\log(n)))$

Auxiliary Space: $O(n)$

Optimizing by removing evens :

```

// the following implementation
// stores only halves of odd numbers
// the algorithm is a faster by some constant factors

#include <bitset>
#include <iostream>
using namespace std;

bitset<500001> Primes;
void SieveOfEratosthenes(int n)
{
    Primes[0] = 1;
    for (int i = 3; i*i <= n; i += 2) {
        if (Primes[i / 2] == 0) {

```

```

        for (int j = 3 * i; j <= n; j += 2 * i)
            Primes[j / 2] = 1;
    }
}

int main()
{
    int n = 100;
    SieveOfEratosthenes(n);
    for (int i = 1; i <= n; i++) {
        if (i == 2)
            cout << i << ' ';
        else if (i % 2 == 1 && Primes[i / 2] == 0)
            cout << i << ' ';
    }
    return 0;
}

```

Output

```
2 3 5 7 11 13 17 19 23 29 31 37 41 43 47 53 59 61 67 71 73 79 83 89 97
```

Time Complexity: $O(n \cdot \log(\log(n)))$

Auxiliary Space: $O(n)$
